Introduction

The roadway network in the City of Hollister, California represents a significant investment by the residents of Hollister. Getting to, from, and around the City depends on the serviceability of its roadway network. When roads become distressed with ruts, potholes, and cracks, it impacts the community: trips take longer, the ride is bumpier, and vehicle maintenance costs increase.

The City of Hollister recently contracted Kimley-Horn to investigate current conditions on City-owned roadways and alleys throughout the City. The information provided in this technical memorandum details the methodology used in collecting and analyzing the pavement distress data and documents existing pavement conditions across the City’s roadway network.

Methodology

Hollister’s roadway network was evaluated and validated in accordance with the standard method for conducting visual pavement evaluations, *ASTM D6433-18 Standard Practice for Roads and Parking Lots Pavement Condition Index Surveys*. Using this method, trained personnel evaluated Hollister’s roadway sections to assess pavement conditions by documenting distresses visible on the roadway surface. The ASTM method relies on selecting representative roadway areas and tabulating pavement distress types, quantities, and severities to determine the Pavement Condition Index (PCI) value for the roadway section. The ASTM method supplemented overall condition ratings generated using a smartphone embedded with artificial intelligence in Phase 1 of the evaluation.

A PCI value of 100 signifies a road in excellent condition while a PCI value of 0 represents a completely failed road. PCI values are assigned a condition category, as shown in **Table 1**. Though beyond the scope of this investigation, maintenance and rehabilitation (M&R) work is typically assigned based on a roadway’s PCI value, functional classification, and priority within the network.

Table 1. Pavement Condition Index (PCI) Categories

Condition Category	PCI Range
Good	86 - 100
Satisfactory	71 - 85
Fair	56 - 70
Poor	41 - 55
Very Poor	26 - 40
Serious	11 - 25
Failed	0 - 10

Pavement conditions worsen over time as loading from vehicle traffic, environmental conditions, and drainage factors undermine the integrity of a pavement’s structure and underlying support layers. M&R activities can slow or reverse this deterioration. When fully implemented, a pavement management program can help to systematically identify preventive maintenance applications before

significant distresses are observed, thereby preserving the condition rather than fixing it later when repairs become more expensive. **Figure 1** shows the financial impact of performing maintenance at different times in the pavement life cycle.

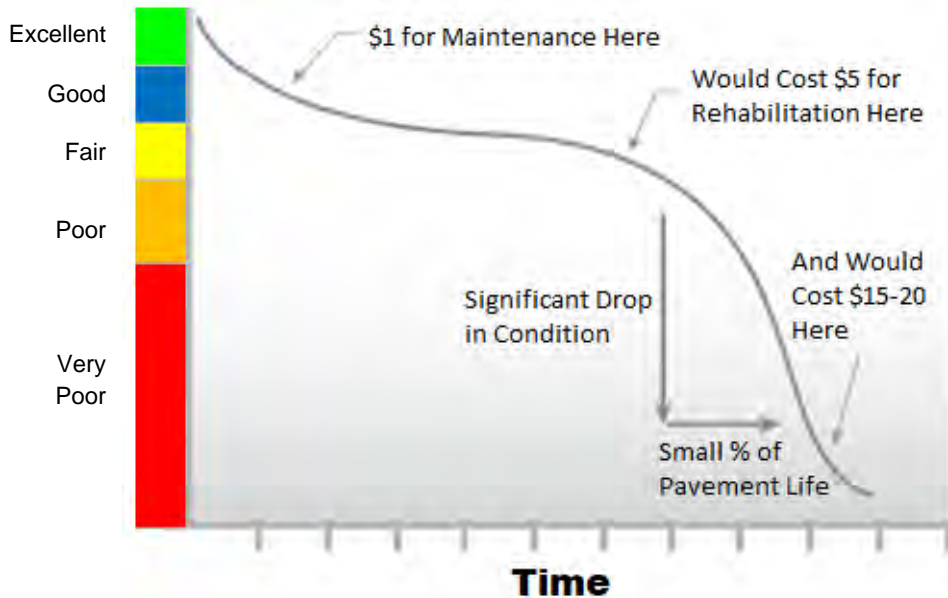

Figure 1. Pavement Conditions Deteriorate Over Time

Maintaining pavements in good condition prolongs financial resources because less costly treatment applications like rejuvenation, surface treatments, and crack sealing can help maintain present conditions. The consequence of applying preventive maintenance treatments late is twofold in that pavement conditions are then likely to deteriorate more rapidly, and that treatment options become more expensive.

System Inventory

Kimley-Horn worked with the City to establish the Roadway System Inventory. Pavement networks are comprised of individual street segments ranging in length from portions of a block to a street’s entire length. Each segment can have individual attributes defining its pavement function and type, geometry, speed limit, construction history, traffic, and existing conditions.

For this evaluation, the City’s pavement network comprises 1,647 roadway segments. Of these 1,647 roadway segments, 70 were not inspected due to the segment being privately maintained. **Appendix A** summarizes the sections not included in this investigation. A total of 1,577 segments were inspected, including 15 Portland cement concrete (PCC) pavement segments and 1,562 asphalt concrete (AC) pavement segments.

Distress Summary

The data collection process focuses on identifying the pavement distress types, extents, and severity levels that lead to a PCI value. The assessment methodology outlined in the ASTM D6433-18 standard relies on a sampling procedure in which representative sample units within a section are selected for survey. The PCI method provides information on the pavement’s condition resulting from traffic loading, environmental conditions, and other factors but does not predict remaining structural life, bearing capacity, or subgrade support characteristics. Such considerations rely on the use of alternative test methods beyond the scope of this study. However, distresses observed on the surface provide an indication of how the pavement and underlying support layers are performing as a system.

A list of pavement distresses captured in PCI surveys is shown in **Table 2** for AC and PCC pavements. Distresses encountered in the Hollister roadway network are shown in bold text. Emphasis is placed on AC pavements as only a small number of PCC sections were encountered during the field investigations.

Table 2. Pavement Distress Types and Distress Codes

Distress Code	AC Distress Type	Distress Code	PCC Distress Type
1	Alligator Cracking	21	Blow Up
2	Bleeding	22	Corner Break
3	Block Cracking	23	Divided Slab
4	Bumps/Sags	24	Durability Cracking
5	Corrugation	25	Faulting
6	Depression	26	Joint Seal Damage
7	Edge Cracking	27	Lane/Shoulder Drop-Off
8	Joint Reflective Cracking	28	Linear Cracking
9	Lane/Shoulder Drop-Off	29	Patching/Utility Cut (large)
10	Longitudinal/Transverse Cracking	30	Patching/Utility Cut (small)
11	Patching/Utility Cut	31	Polished Aggregate
12	Polished Aggregate	32	Popouts
13	Potholes	33	Pumping
14	Railroad Crossing	34	Punchout
15	Rutting	35	Railroad Crossing
16	Shoving	36	Scaling
17	Slippage Cracking	37	Shrinkage Cracking
18	Swelling	38	Corner Spalling
19	Raveling	39	Joint Spalling
20	Weathering		

Smartphone data collection for the Phase 1 assessment occurred in April 2021 and PCI field evaluations for the Phase 2 assessment were completed in May 2021. Phase 1 results helped identify locations for the more focused Phase 2 evaluations. Due to the more detailed formulation of PCI values, the PCI values should take precedence over the ratings generated in Phase 1 using automated methods.

The PCI field evaluation process begins with marking out sample units within designated areas. Evaluation teams confirm key dimensions like roadway width and length using measuring wheels and GPS-enabled devices. Sample unit extents are marked on the pavement surface and define the boundaries of the area to be inspected. Within the sample unit, distresses are recorded according to type, severity, and extent using measuring wheels, scales, and other handheld measurement devices. **Figure 3** illustrates some of the measurements taken to identify distress type, severity, and extent.

Figure 3. Typical PCI Field Measurements

Distress types frequently observed across the City's pavement network are related primarily to load, climate, construction, and other factors. Load-related distresses arise from both static and dynamic tire interaction with the pavement surface. Climate-related distresses include those distresses caused by variations in temperature and asphalt binder oxidation. Distresses can also be caused by other factors such as construction or utility maintenance. **Figure 4** and **Figure 5** show the prevalence of distresses encountered throughout Hollister for AC and PCC pavements, respectively.

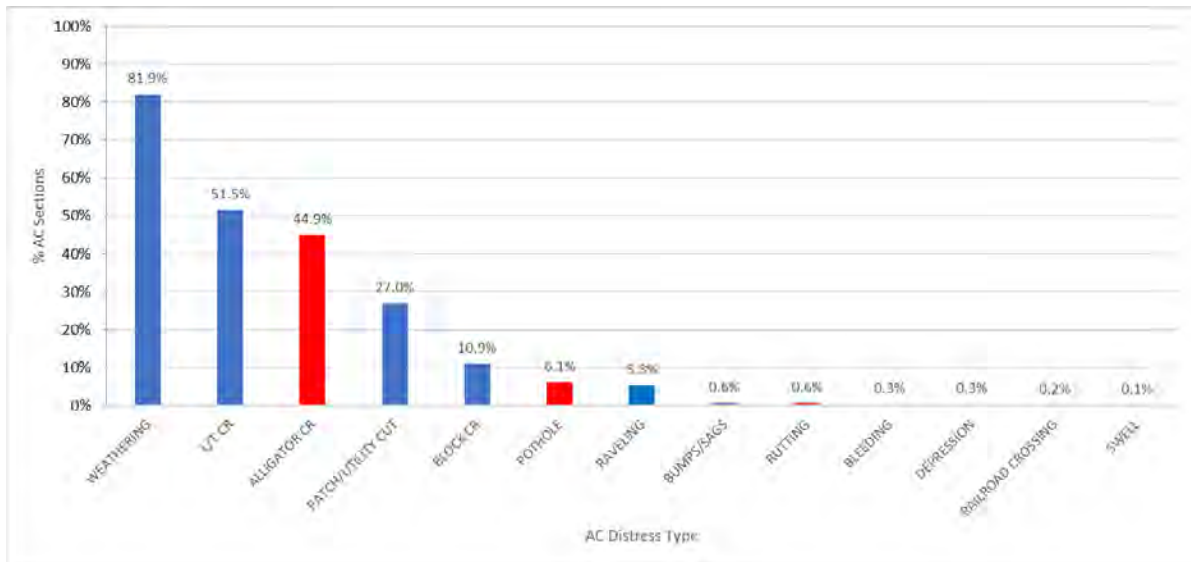

Figure 4. AC Distress Summary

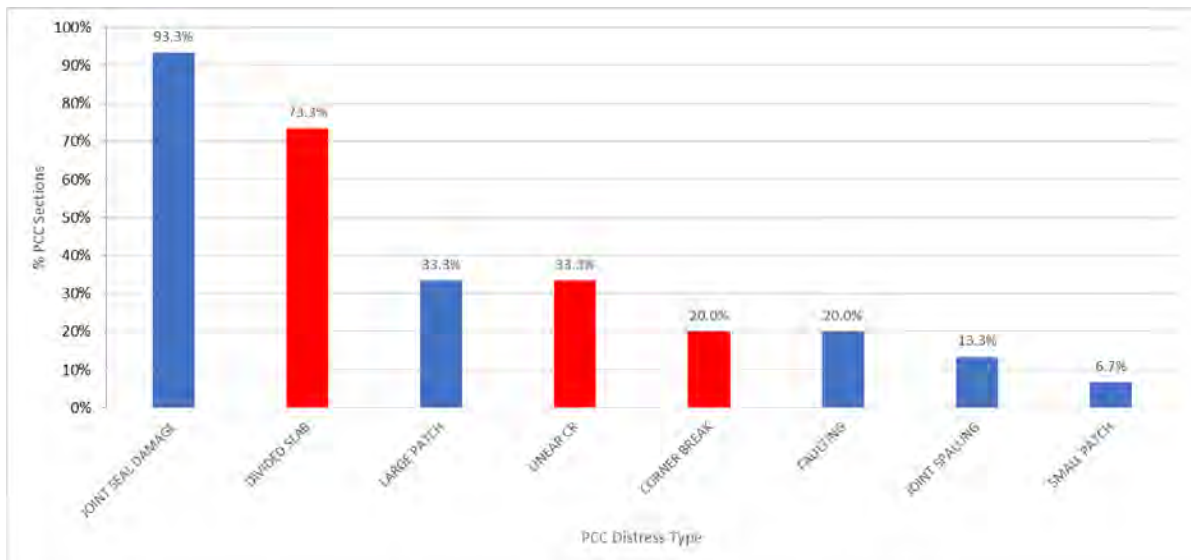

Figure 5. PCC Distress Summary

Condition Results

As of May 2021, PCI results indicate the City of Hollister’s roadway network is in *Satisfactory* condition with an overall PCI value of 74. The distribution of conditions is shown in **Figure 6** by area (in SY) and percent. Approximately 42% of roadways are in *Good* or better condition, and 77% of roadways are *Fair* or better. Roadways in *Poor* condition or worse comprise approximately 23% of the network. This distribution of conditions is relatively well-balanced across condition categories, suggesting that a range of M&R treatment options is appropriate to remedy present deficiencies.

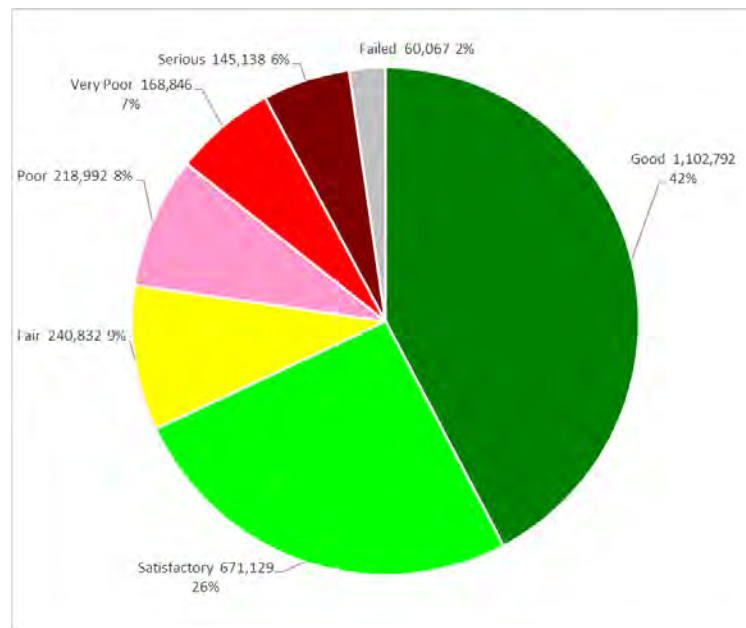

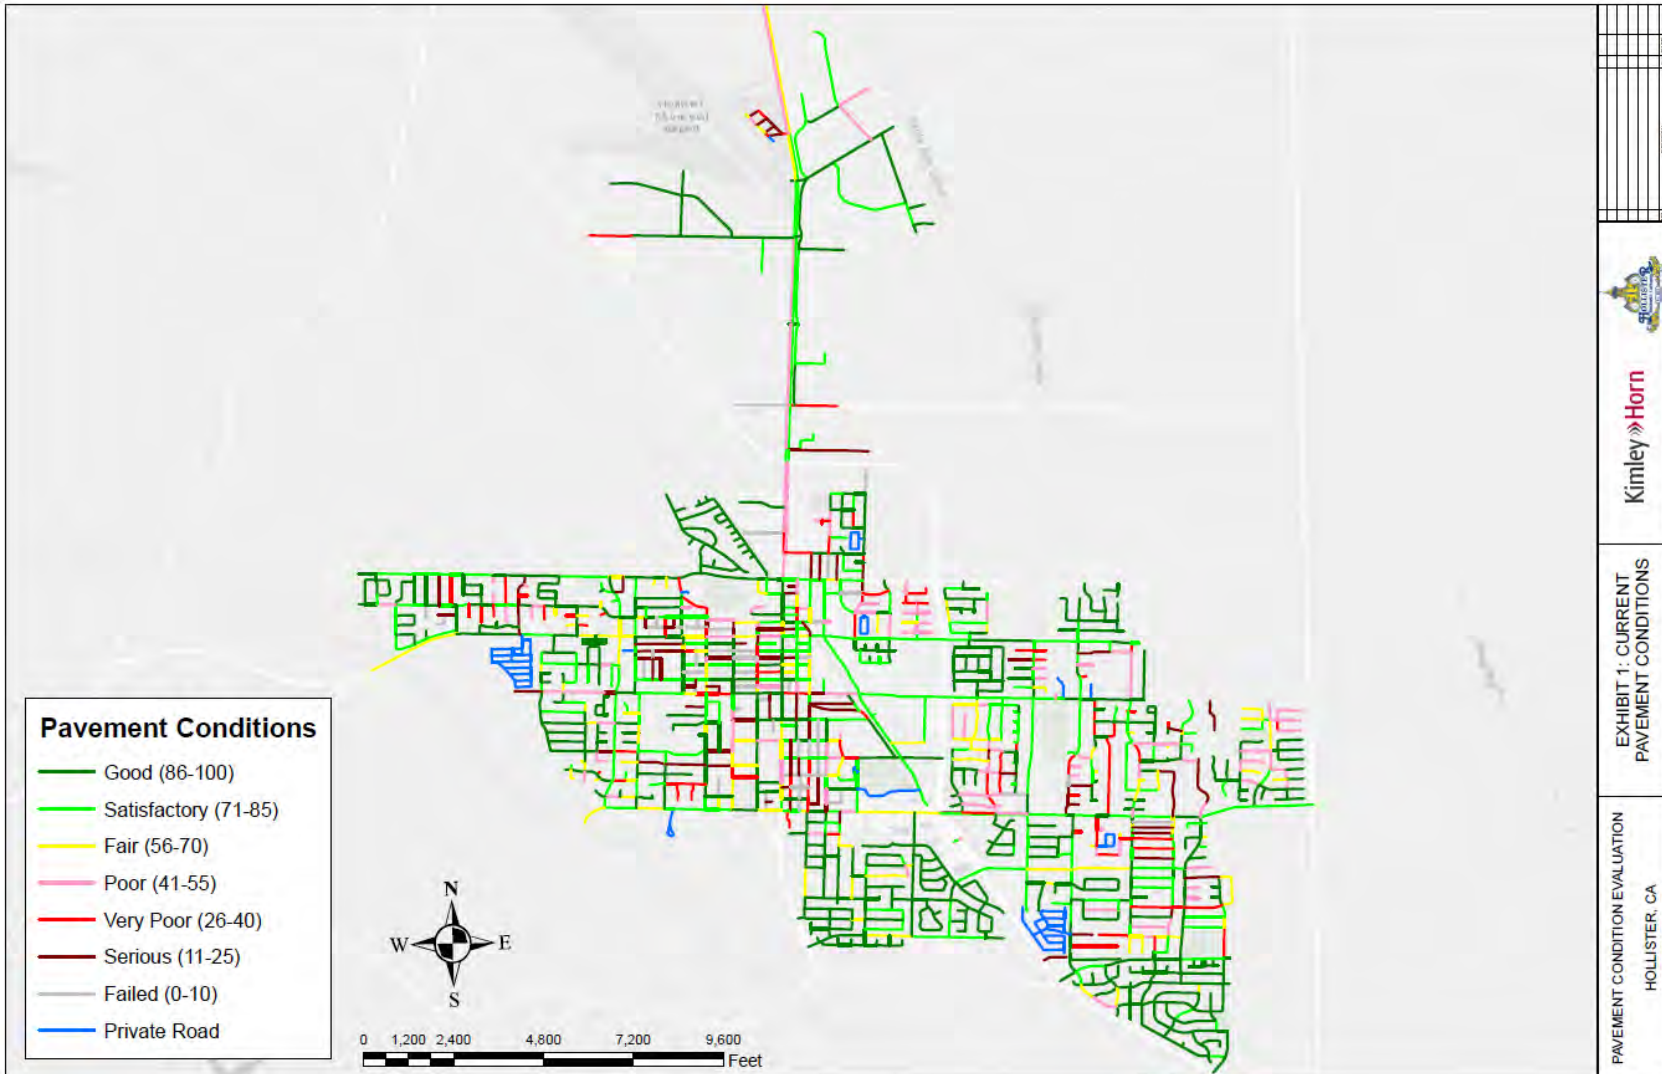

Figure 6. Pavement Condition Distribution

Condition summaries by branch and section are included to highlight conditions of individual roadway segments. The roadway branch refers to an entire street, whereas a section typically refers to a block-to-block section of the roadway. **Appendix B** and **Appendix C** summarize branch conditions alphabetically and by overall condition, respectively. Individual condition results for each of the 1,577 sections are available in **Appendix D**. Results are also summarized spatially in **Exhibit 1**.

Exhibit 1. Current PCI Conditions

Recommendations and Closure

The essence of pavement management is applying the correct M&R treatment to the correct roadway at the correct time. Keeping roads in *Fair* or better condition costs less than if conditions slip into *Poor* or worse condition. The results of this investigation indicate that that **Hollister's roadway condition is rated as *Satisfactory* with a PCI value of 74** as of May 2021, but conditions will continue to worsen in the absence of sustained and targeted funding.

The pavement condition analysis summarized here was conducted at the network level and is not meant to replace the engineering and planning judgment required for project-level analysis and design work. It should be noted that Kimley-Horn has no control over the cost of labor, materials, equipment, or broader market conditions. Projects identified as needing work in the near-term should be evaluated by the City on a case-by-case basis to ensure that the network-level decisions appropriately translate to the individual project.
